

DR. ANDREWS

BOARD CERTIFIED PLASTIC SURGEON

**BEFORE &
AFTER**

ABOUT DR. ANDREWS

Dr. Kahlil Andrews is a board-certified plastic surgeon from Los Angeles specializing in plastic, cosmetic and reconstructive surgery.

Located in Cedar Rapids, Iowa, Dr. Andrews' academic and technical achievements are only exceeded by his commitment to patient care. Whether they are seeking reconstructive breast surgery, outpatient injectable treatment, or a full-blown mommy makeover, Dr. Andrews gives his full attention and focus on achieving excellent patient outcomes.

“All my life I wanted to be a surgeon. Coming from an artistic family, I was drawn to plastic surgery. I understand how important it is to look and feel your best at any age, and no matter what condition you have. Through my practice I am able to help reconstructive patients realize their goal of restoring function and assist cosmetic patients in reviving and enhancing form.”

Born and raised in Los Angeles, California, Dr. Andrews developed a passion for medicine. Motivated by his deep desire to become a surgeon, Dr. Andrews excelled at Fairfax High School and earned admission into the world renowned University of California at Berkeley where he studied Molecular and Cell Biology.

Dr. Andrews decided to continue his studies in California and attended a top five medical school – University of California, San Francisco. He was inducted into the Alpha Omega Honor Society, a designation reserved for students graduating in the top ten percent of the class.

Dr. Andrews left California in pursuit of his dream to become a surgeon. He matched at the Johns Hopkins Hospital General Surgery Residency Program. It was through his association with Hopkins that he received a Resident Research Fellowship at the Department of Surgical Oncology at the Jonsson Cancer Center at the University of California, Los Angeles where he studied genetic immunotherapy. Dr. Andrews has presented at national and regional Society meetings and is published in numerous peer-reviewed medical

THANK YOU
for being
SO KIND.

And changing my
life! I love
my new nose 😊

Dr. Andrews,

THANK YOU. (Times a million) I can't
express in words how thankful I am that
you gave me confidence, & made me feel normal.
Thank you for taking great care of me,
even when I was a pain in the butt!
Thank you for talking to me about my
school & for giving me advice about my
life goals. Thank you for being someone
I look up to.

You change
people's lives! words
cannot express how
MUCH I love my new
girls 😊 Thank you
SO MUCH for giving
me exactly what I
wanted. you are
amazing!

Dr. Andrews,

We received positive patient comments from
a few of your patients regarding the care you
provided while at St. Luke's. They stated, "Dr.
Andrews is so wonderful. I couldn't be in
better hands. He is so caring and has a great bedside
manner. I'm so pleased with my outcome. He
was very attentive during my stay. He is awesome!
He is one of the nicest, caring doctors I have ever
had. I feel so blessed to have him as my surgeon."
We appreciate the care you provided to our patients.
Please enjoy a beverage on us!

Thank You!

Dr. Andrews

Thank you for putting up
with me and for everything you've
helped me with... you've helped
me come a long way and I will
keep referring! 😊
I will be a continued happy
customer... I've already had
booby compliments! 😊

MOMMY MAKEOVER

The “mommy makeover” combines several procedures to address cosmetic and functional concerns after pregnancy.

Mommy makeover intends to address the changes that occur following pregnancy and breast-feeding. Typically patients elect for a tummy tuck with liposuction and breast rejuvenation.

Breast rejuvenation can involve breast augmentation, breast lift, breast lift combined with augmentation, or breast reduction. In most cases the procedures are preformed in a single stage. The surgery is designed to restore form and shape that existed prior to pregnancy. Dr. Andrews is a specialist in Mommy Makeover surgery and has had great success preforming the procedures in one stage.

“

I could not have asked for a better experience with Dr. Andrews Plastic Surgery. I had a mommy makeover which was quite an extensive surgery but never felt worried or concerned before or after the procedure. Dr. Andrews as well as all of the staff were friendly, professional and responsive to all my needs. Nurses Stormy and Emma and Surgical Tech Natalie were great at my pre op appointments, the day of surgery and my post op appointments. My results are amazing, better than I could have ever imagined! I 100% would recommend Dr. Andrews Plastic Surgery to my friends and family!

CASE 4

CASE 5

CASE 6

TUMMY TUCK

Dr. Andrews helps you achieve your cosmetic goals with a tummy tuck procedure customized just for you.

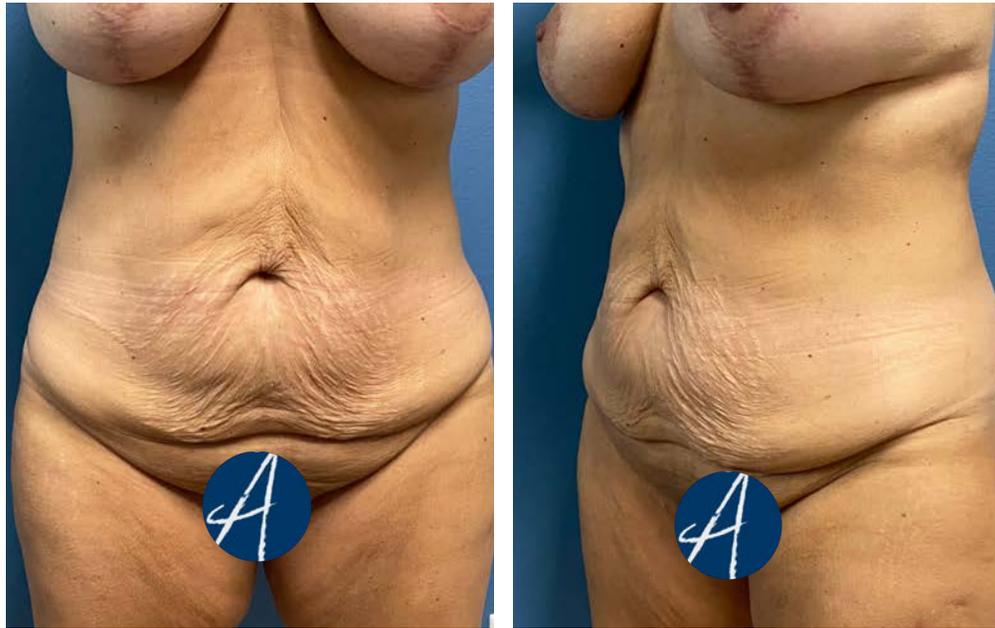

The appearance of your abdomen is often considered a mark of desirability and fitness. If it's firm and toned, you're viewed as being in shape, but if you have sagging skin and weakened abdominal muscles, then your body may not adequately reflect your lifestyle.

Although important, diet and exercise may not always be able to give you the results you want, particularly if loose skin is part of the problem. To help restore the appearance of your abdomen, you might consider a tummy tuck (abdominoplasty) as your next step.

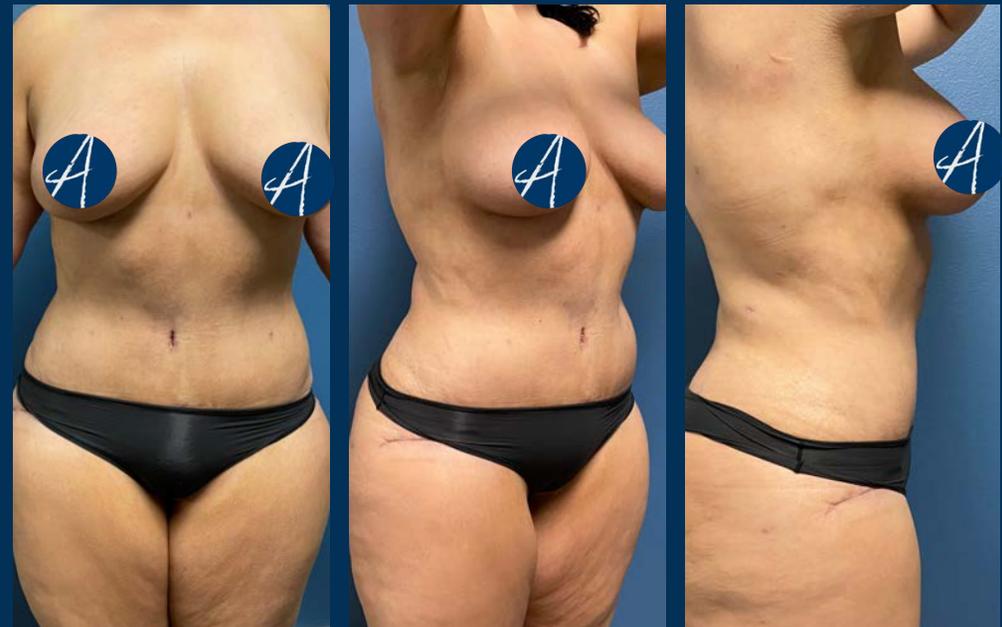

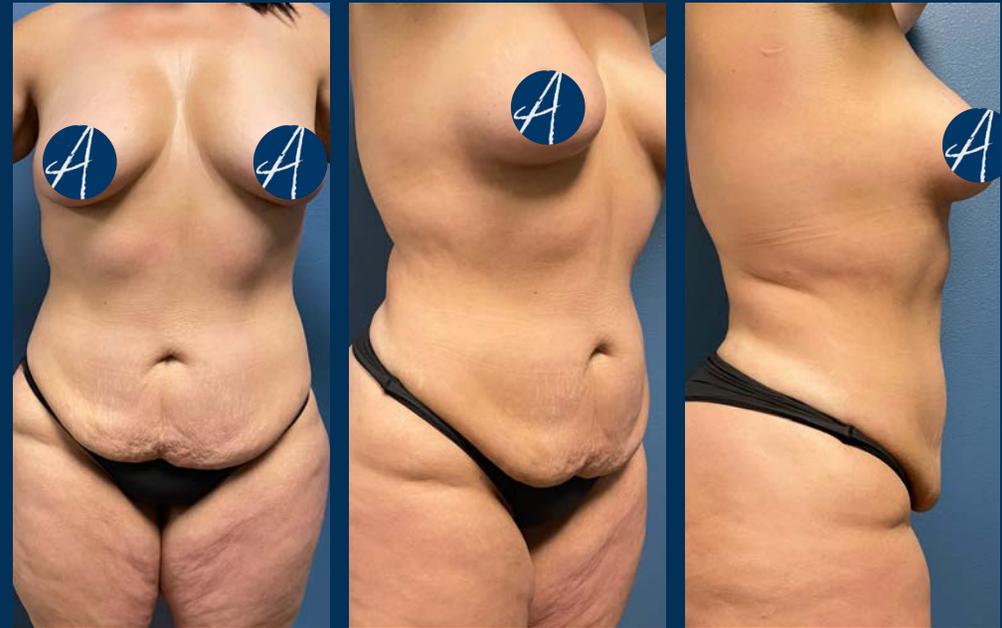

“

I am very grateful to Dr Andrews and his incredible staff for my tummy tuck and lipo surgery! They helped me remove a part of me that caused severe emotional, mental, and physical anguish. Their staff took amazing care of me and went above and beyond when my body needed more time to heal. I truly feel like family!

CASE 8

LIPOSUCTION

“Liposuction is an excellent way to re-contour or reshape problem areas.”

Having a slim and toned appearance is important for many individuals, but for some, achieving the ideal figure is easier said than done. You may eat a balanced diet and exercise regularly, but it may not be enough to totally eliminate fatty deposits from various regions on your body.

When you’ve exhausted many of the options, it’s time to consider liposuction. Liposuction is one of the most sought-after procedures for patients who want to reduce stubborn body fat and create an appealing body contour. With a one-on-one consultation and a discussion of your cosmetic goals, you can decide whether liposuction is right for you.

HOW DOES LIPOSUCTION WORK?

Liposuction uses a narrow tube and suction device to remove excess fat from under the skin. Certain localized fatty deposits can be unresponsive to diet and exercise, which might be contributing to your frustration when you don’t achieve the results you want.

Liposuction targets fat specifically, permanently removing it from the body. As a result, your contour is improved and hopefully your self-esteem as well. Liposuction is often combined with other cosmetic procedures such as a breast augmentation, breast reduction, or tummy tuck.

ARE YOU A CANDIDATE FOR LIPOSUCTION?

Although liposuction is an excellent option for reducing excess fat, it will not tighten the skin. Therefore, the procedure is generally more effective in patients who have tighter skin around the region being treated. Loose skin may not respond satisfactorily to liposuction and could require additional surgery to correct.

Liposuction is also ineffective in treating cellulite, and is not a replacement for a healthy diet and regular exercise. Those who benefit from liposuction are patients who are near their ideal weight, have adequate skin elasticity, and have a realistic vision for their results.

RECOVERING FROM LIPOSUCTION

Dr. Andrews will give you post-operative instructions once liposuction is complete, explaining how you should care for your small puncture incisions. Dr. Andrews will also prescribe oral medications to lessen any pain while you heal, and he will schedule a follow-up appointment to ensure you are recovering properly.

It may take a few weeks before the swelling subsides enough for you to see your results, but liposuction should remain permanent as long as you maintain a stable weight and healthy lifestyle. In time, you will experience the benefits of a toned body contour, which will improve your confidence and self-image.

CASE 10

BREAST AUGMENTATION

“It’s all about self-confidence.

This is the most frequently requested surgical procedure. I love to see the physical and emotional transformations it brings.”

You may be able to trace your decision for breast augmentation back to your desire for improved self-confidence. For many women, your breasts are an integral part of your femininity, but having breasts that look disproportionate to the rest of the body can affect your self-image.

Breast augmentation uses an implant to enlarge or reshape your breasts. Ultimately, the goal is to add fullness to the breasts in a way that looks natural. Through the insertion of an implant, Dr. Andrews can change the size, shape, weight and feel of your natural breasts.

“

Dr. Andrews and his staff were so friendly and knowledgeable. They made me feel so comfortable and prepared for my surgery that I went into it with 100% confidence. The 3D image for a breast augmentation was so close to what it actually looks like. The surgery was so smooth, and I healed shockingly fast. I told the staff there that I was amazed with how well everything it was all going and how painless it was. My implants look so good and I’m so happy with them!

BREAST FAT GRAFTING

“Breast augmentation with fat allows breast enhancement without implants.”

Some women choose to have breast enhancement without devices. One option that has grown dramatically in popularity in the last ten years is the use of autologous fat transferred from areas of excess to the breast.

Patients benefit in two ways with this procedure. They experience a contour improvement in the areas where the fat is removed and enhancement of breast size and shape where the fat is injected. We can create a custom size and can fill specific areas of deficiency. Breast augmentation with fat may allow us to be more creative as opposed to using breast implants alone.

What happens during a fat transfer breast augmentation?

A fat transfer breast augmentation is an outpatient procedure. You go home the same day. You receive general anesthesia to help you sleep through the surgery.

During the procedure, your provider:

- Uses liposuction to harvest fat deposits from several areas of your body.
- Runs the fat cells through a centrifuge device to remove any impurities.
- Uses special syringes to inject the purified fat cells into different tissue layers inside of your breasts.

BREAST REDUCTION

“Breast reduction can be a life-changing procedure for patients with chronic neck, back, and shoulder pain because of large breasts.”

Large breasts often cause symptoms that are only addressed with a breast reduction. Patients with large breasts can have chronic neck, back, and shoulder pain. Patients will also have grooving in their shoulders from bra straps and can be troubled by rashes and fungal infections under their breasts. Breast reduction is often covered by insurance if a threshold amount of tissue is removed. In addition to removing excess breast tissue, your breasts will also be lifted — giving them a more youthful appearance. Of all the procedures that plastic surgeons perform, breast reduction is at the top of the list with respect to patient satisfaction.

“

Dr. Andrews & crew were great answering any questions I had and making my breast reduction a quick and easy process, even with my special requests. I felt comfortable and had no trepidations. Ultimately the results are just what I wanted. Best decision ever :)

CASE 5

CASE 6

BREAST LIFT & AUGMENTATION

“There are some plastic surgeons who do not perform a breast lift with augmentation in a single stage, but this is often the best approach for most patients.”

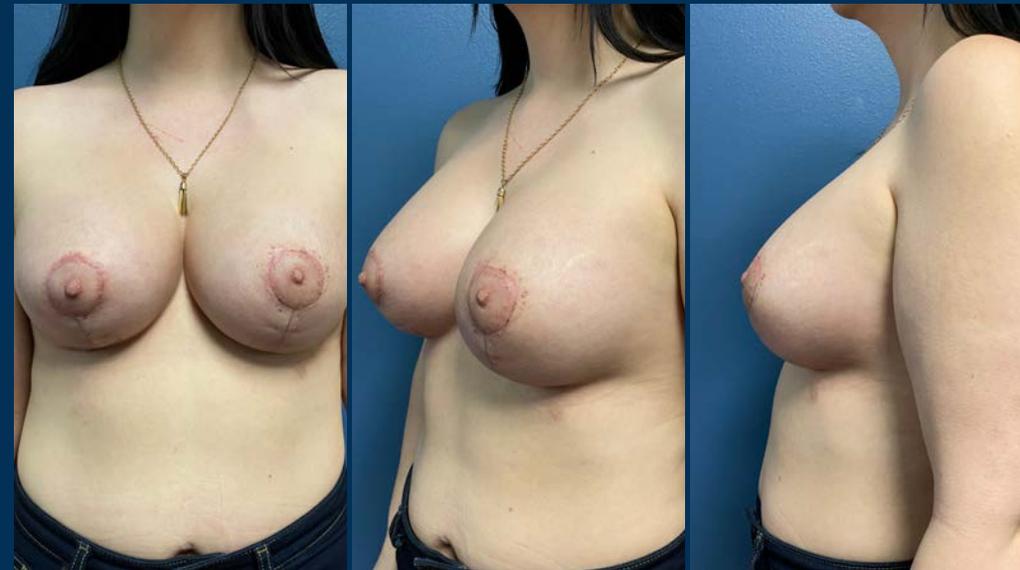

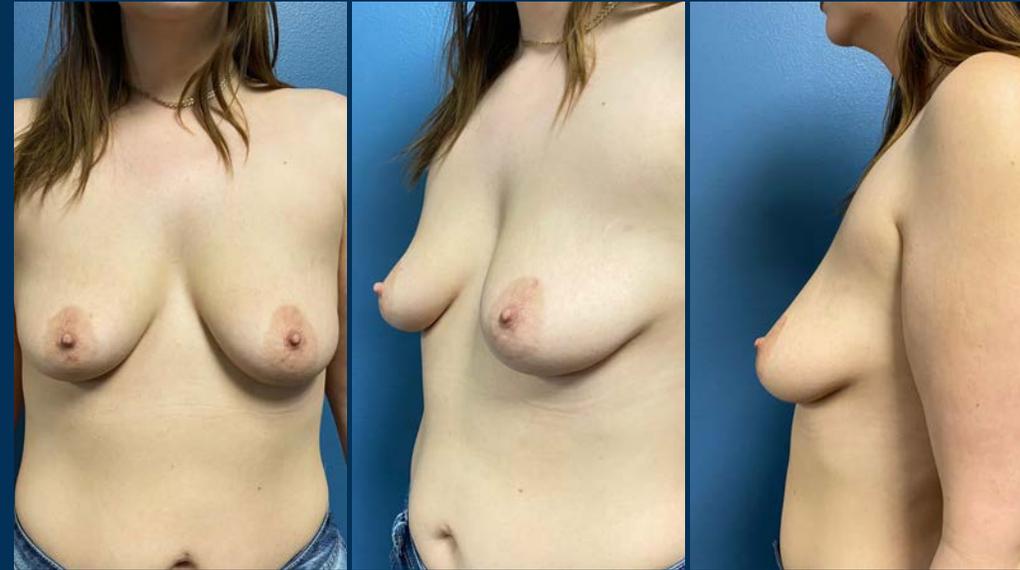

Patients with breasts that sag often require replacement of volume in addition to a lift procedure. These procedures can often be performed in a single stage, which is more time and cost efficient for the patient. Dr. Andrews has extensive experience performing the procedures in a single stage.

“

I've never had any cosmetic procedures done before and my husband and I came in for a consultation for breast lift with augmentation. Emily put us at ease right away asking us what our wants and expectations were and answering all our questions. She had me put a special bra and t-shirt, and I tried different size implants on. That was as so helpful! Then she took pictures of my breasts from different angles and sent a simulation of what I may look like after the procedure. Wow! It was exactly what I had envisioned! Dr. Andrews spent a lot of time with us too. Drawing pictures of the incisions and explaining how the lift would work. We love his energy and are very impressed with his practice.

CASE 2

CASE 3

CASE 4

CASE 5

CASE 6

BREAST REVISION

The goal of breast implant revision surgery is to replace old breast implants with new implants. Often the goal is also to change or improve the appearance of the breasts while updating the implant material, which could include:

- A concurrent breast lift or reduction
- Reshaping the breast implant pocket to reposition the implant on the chest
- Either increasing or decreasing the size, shape or style of the breast implant

The desire to have breast implant revision surgery can be because of any of the following reasons:

- Desire to change the size of the breasts
- Capsular contracture
- Concern about rupture or migration of implant
- Change from saline to silicone or different style of implant
- Significant weight loss or change in skin elasticity

Over time, breast implants can change shape or size, and the overlying breast tissue can also change, creating an appearance or feel to the breast that is less desirable than the original result. Also, many breast implants have a lifetime warranty on the actual implant device, but after ten years the costs associated with having surgery to replace the implants are no longer covered. Because of this, many women will elect to replace or update their breast implants at or around the 10-year time frame

CASE 3

CASE 4

BRAZILIAN BUTT LIFT

If you've been wishing for a fuller, perkier, more defined derrière, it may be time to consider a Brazilian buttock lift. A BBL can give you a more shapely buttock profile while simultaneously slimming a problem area with stubborn fat. The result is not just a better butt, it's a more appealing body contour overall and a major confidence boost.

What Is a Brazilian Buttock Lift?

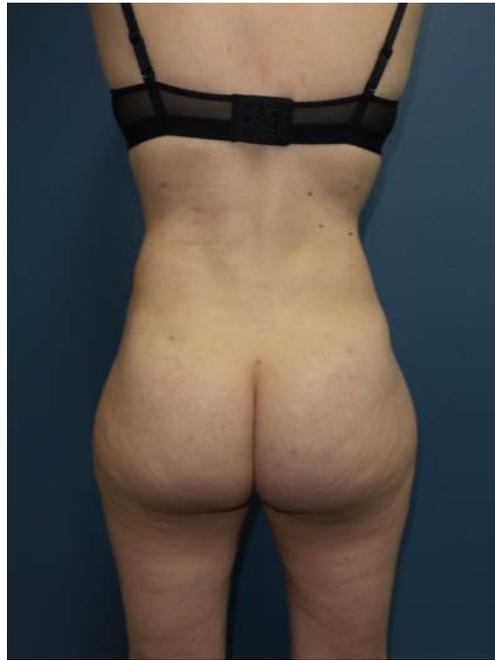

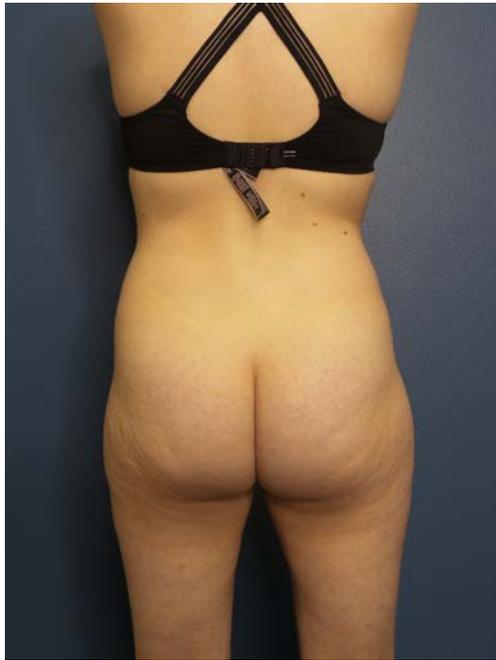

The BBL technique is a method of enlarging or improving the shape of the buttocks using fat injections. During the procedure, excess fat is extracted from elsewhere on the patient's body with liposuction and strategically injected into the buttocks to enhance shape and volume. Though it is not a completely nonsurgical buttock lift, it is a minimally-invasive procedure that leaves behind very little visible scarring. One of the many advantages of this technique is that it achieves improvements in multiple areas of the body at once — in addition to enjoying a firmer, rounder buttocks, patients also enjoy slimmer contours in areas they could not improve with diet and exercise. Many patients also appreciate that fat transfer provides natural-looking, natural-feeling results that do not involve inserting a foreign object into the body.

Am I a Candidate for a Brazilian Buttock Lift?

Buttock augmentation is one of the fastest-growing plastic surgery procedures in the United States, but it is not right for everyone. The ideal patient for a BBL is in good health generally and has an adequate amount of excess fat somewhere on their body, typically around the abdomen, love handles, hips, thighs, arms and/or back. A good candidate for any surgery should be a nonsmoker and should have realistic expectations about the procedure, the recovery and the results.

Individuals with insufficient fat available for harvest are not good candidates for a fat transfer buttock augmentation. Those with a significant amount of excess, sagging skin around their hips, buttocks or thighs may also find that a different procedure is more appropriate for their concerns.

CASE 1 & 2

CASE 3 & 4

ARM LIFT

“Patients with excess skin in their arms often liken to it to “bat wings.” Removal of that tissue allows patients to feel much more comfortable with their arm contour.”

Drooping upper arms can be caused by weight change, aging or simply by heredity. Exercise and muscle toning sometimes just isn't enough. When skin has lost elasticity, and localized fat deposits cause the upper arm to sag, an arm lift (brachioplasty), can address these issues, improving the overall appearance of firmness and youth.

Dr. Andrews has performed many successful arm lift procedures. He takes great time and care to understand just exactly what this patient needs and what her/his expectations are. He will work to understand and create the best possible outcome for you. Dr. Andrews is here to help you decide whether an arm lift will be right for you.

Is an Arm Lift Right for You?

Since arm lifts are relatively low-risk cosmetic surgeries, they are appropriate for a wide range of patients — women and men, older and younger and with varying degrees of upper arm sagging. They are also commonly performed alongside other body sculpting surgeries, such as tummy tucks, especially in the case of drastic weight loss that has left behind stretched and sagging skin.

In all, the main requirements for an arm lift are that you have noticeable sagging skin on your upper arms, are in good health, do not smoke and do not have any significant health concerns that would prevent you from successfully undergoing and recovering from surgery. Dr. Andrews always ensures his patients' utmost safety, and this includes suggesting alternatives to surgery for people who are at particular risk for complications. If you are not a good candidate for an arm lift now, you can always work with Dr. Andrews to find other options or to make lifestyle changes that will allow you to become a candidate for the procedure in the future.

CASE 3

CASE 4

GYNECOMASTIA

“Young men can be emotionally affected when they have over-developed breast tissue.”

Male breast reduction can have dramatic effects on a male's comfort level with their chest. The procedure can often be performed with a small incision at the base of the breast, avoiding an incision around the areola. Dr. Andrews is very skilled in performing this minimally invasive approach to gynecomastia.

If you want to work with an surgeon and staff that really cares about what they are doing, then Dr. Andrews Plastic Surgery is the place to go. They always take time to explain everything that is going to happen, and how to take care of yourself post procedure. They are very professional and make you feel at home when you are there. You can really tell that they care about the patient, and focus a lot on the artistic aspect. Highly recommend going here if you want the best care possible.

CASE 1

CASE 2

CASE 3

CASE 4

RHINOPLASTY

“When you are unhappy with the way your nose looks, it can create serious self-confidence issues.”

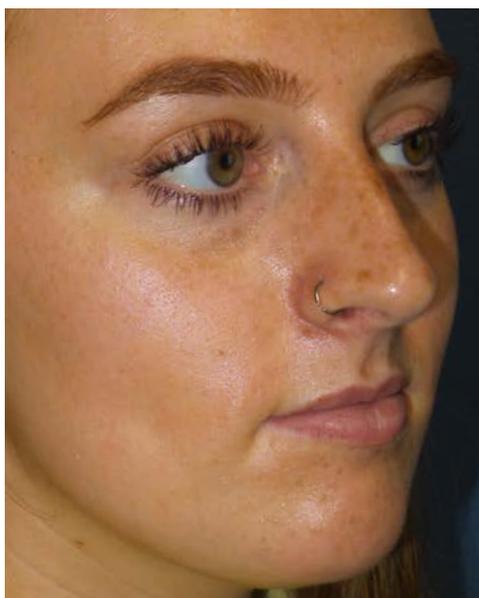

The nose sits front and center on your face, so abnormalities like a bulbous tip or a large bump on the bridge of the nose may lead you to seek a permanent solution.

Dr. Andrews provides a surgical procedure called rhinoplasty to enhance the overall appearance of the nose. Also referred to as a “nose job,” nose surgery or nose sculpting, this cosmetic procedure helps to improve the shape, structure and proportional balance of the nose*.

Ideal Candidates

While nose surgery is most commonly sought by those looking to make their nose smaller or to achieve a more pleasing, symmetrical shape there are other benefits of the procedure. Rhinoplasty can also be beneficial for those with a deviated septum or narrow airways, both of which can affect breathing. Additionally, nasal surgery is also able to correct deformities after nasal trauma.

CASE 1

CASE 2

CASE 3

CASE 4

BLEPHAROPLASTY

“Patients often seek eyelid surgery to brighten their appearance and give them a less tired look.”

Known as an eyelid lift, eye lift, or blepharoplasty – a surgical procedure which restores a youthful appearance to tired,

or aged-looking eyelids caused by reduced elasticity and weakened muscles. An eyelid lift procedure will likely achieve the following improvements in the appearance of your eyes:

- The removal of excess derma (skin) from your lower eyelids
- Reduction of puffiness in your upper eyelids
- Eradication of drooping skin or bags under your lower eyelids
- Improved vision by removal of sagging skin on upper eyelids

Upper Eyelid Surgery

During upper eyelid surgery, Dr. Andrews makes small incisions in the skin of your upper eyelid, hidden in the natural folds of your skin. From these incisions, he will trim away any stretched, loose, drooping or excess eyelid skin. Dr. Andrews will suture the remaining skin in place, which lifts heavy eyelids so they no longer fall over your lash line or into your line of vision.

Lower Eyelid Surgery

Lower eyelid surgery involves a small incision typically placed just below the lower lash line to keep scars well-hidden. Through this incision, Dr. Andrews can remove or reposition the pad of fat that causes under eye bags. This gives you a smoother under eye area without hollows, puffiness or discoloration. Dr. Andrews can also manipulate underlying musculature to correct unwanted wrinkles.

CASE 4

LOWER BLEPHAROPLASTY

FACE LIFT

“The function of the face is to provide a medium to interact with the world.”

With age comes fine lines, wrinkles and volume loss, and their increasing progression may make you feel self-conscious about your appearance. Although natural aging is a fact of life, it's not impossible to turn back the clock and recapture youthful qualities in your face.

As an option for cosmetic enhancement, you may want to consider facelift surgery — a procedure that targets the facial muscles and excess skin that's making you appear older. Dr. Andrews performs facelift surgery in a private and modern environment.

IS A FACELIFT RIGHT FOR YOU?

You might view a facelift as the most efficient way to reduce visible signs of aging, but it's not always the right procedure for everyone who wants to look younger. Dr. Andrews will design your facelift around the particular problem areas you've noticed, which could include:

- Creases along the lower eyelids
- Facial folds starting from the nose and traveling to the mouth
 - A loss of fat in the cheeks and around the eyes
 - The appearance of jowls in the lower face
 - Sagging in the midface region
- Loose skin and fatty deposits in the neck and chin

Facelift surgery is beneficial for those who display moderate to severe facial aging, and who have realistic expectations regarding their results. However, it may also be an appropriate option if you're exhibiting only the beginning signs of aging, as it can produce significant results and dramatically restore a youthful appearance. During a personal consultation, you and Dr. Andrews can determine whether facelift surgery is right for you.

FINDING THE RIGHT TECHNIQUE

Dr. Andrews will examine the quality of your skin to understand the best way to approach your facelift and create the most natural result. Depending on the amount of skin laxity and volume loss present, Dr. Andrews will choose the best technique.

Facelift procedures vary, depending on your cosmetic goals. A more traditional facelift will start with an incision at the hairline near the temples, and wrap around the ears toward the back of the scalp. For rejuvenation that focuses on the neck and jowls, an incision might begin in front of the earlobes and end at the lower scalp.

Regardless of the incisional technique, Dr. Andrews will focus on eliminating fatty deposits, excising lax skin, and repositioning facial tissues. Your facelift is also an ideal time to receive additional rejuvenation procedures such as an eyelid or eyebrow lift.

CASE 1

CASE 2

CASE 3

CASE 4

MY ELLEVATE

A sculpted jawline is one of the ultimate symbols of beauty. Unfortunately, the natural skin aging process can take a toll on even the most defined chin and jawline. Saggy skin and fat eventually starts to gather near this area as you age, leading to jowls and submental fat underneath the chin. While a facelift or neck lift can lift and tighten the skin, not everybody is ready to undergo invasive surgery.

Fortunately, you don't have to, thanks to MyEllevate®. This nonsurgical, minimally invasive procedure can sculpt the tissue around your jawline and neck without incisions. The best part: MyEllevate delivers dramatic, long-lasting results with few side effects and minimal downtime.

MyEllevate® uses an ICLED® light-guided system that allows a suture to be placed via a series of guided needle punctures without the need for incision-based open surgery. A single, continuous suture is woven in the neck beneath the jawline area with this light-guided technology. The procedure takes approximately one hour, and recovery is faster than traditional neck lift surgery due to the clean puncture system that is used. The results from MyEllevate® last for five years or more. The MyEllevate® treatment can also be combined with other skin tightening and fat removal procedures to optimize results.

CASE 5

LABIAPLASTY

The labia or “lips” is the tissue that is external to the vagina, and is comprised of the inner lips, or the labia minora, and the outer lips, or the labia majora. The labia minora can sometimes extend beyond the boundaries of the labia majora, and cause problems such as chafing in clothes, chafing with exercise or even walking, discomfort or pain with sexual activity. It also contributes to an undesirable appearance in clothing, such as the ever-popular yoga pant.

Not only does a labiaplasty address the physical appearance, it also promotes improved functional aspects as well. Women seek more confidence while wearing clothing and want relief from chafing, and to not have pain or discomfort with intercourse. Some women live with chronic urinary tract infections or have difficulty with maintaining hygiene, and these circumstances can be drastically improved with a labiaplasty. Dr. Andrews and his team are dedicated to promoting confidence, self-esteem, and quality of life for all patients who are distressed by this condition.

Ever since I was a teen, I've been unhappy with my asymmetrical labia. In the last few years I've found it uncomfortable when being more active such as using certain equipment in the gym and cycling. Not to mention it had made me extremely self conscious. This made me curious about getting the problem corrected surgically, so I did a lot of research online and realized that this is quite a common problem for many women and this gave me confidence to pursue the surgery. I found Dr. Andrews and booked my consultation. Dr. Andrews and his staff made me feel so comfortable during my consultation, and answered all my questions. At the end of the consultation I was happy to place my trust in Dr. Andrews, and was excited to book my procedure. The procedure was painless thanks to relaxing medication and lots of numbing and only took just over an hour. Dr. Andrew's and his staff were absolutely wonderful, helping calm my nerves and talk me through every step of the procedure. I couldn't be more happy with my results and I wish I had known about labiaplasty years ago. I feel more confident and have zero discomfort anymore. If you dislike anything at all about your labia or have discomfort, don't wait and talk to Dr. Andrews. My only regret is not knowing I could have had this fixed a long time ago!

NEOGRAFT

Nearly 80 million men and women struggle with hair loss in the United States. Whether the cause is genetic, hormonal or illness related, losing hair is never easy. A full head of hair is often a source of pride, a sign of youth and vitality or an essential aspect of personal style. Hair type and color can deeply affect your sense of identity, and even be a connection to your family or heritage. Losing your hair can feel like losing a part of yourself, and it can negatively impact your confidence and self-worth.

NeoGraft brings an all-new, technology-driven approach to a treatment called follicular unit excision, or FUE — the current industry standard for high-quality, natural-looking hair restoration surgery. The automated tools used in the NeoGraft procedure replace painstaking handheld techniques that have limited hair restoration surgeons for many years. With NeoGraft, you can get more reliable results with a faster treatment and a quicker recovery process.

Why Choose NeoGraft?

NeoGraft offers many benefits over traditional FUE, and over other approaches to hair restoration surgery.

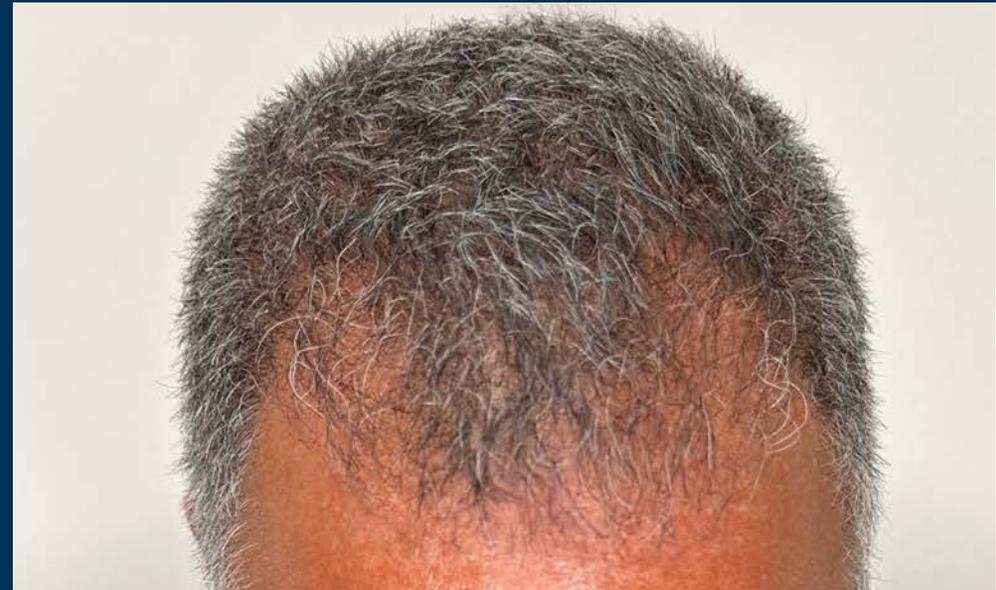

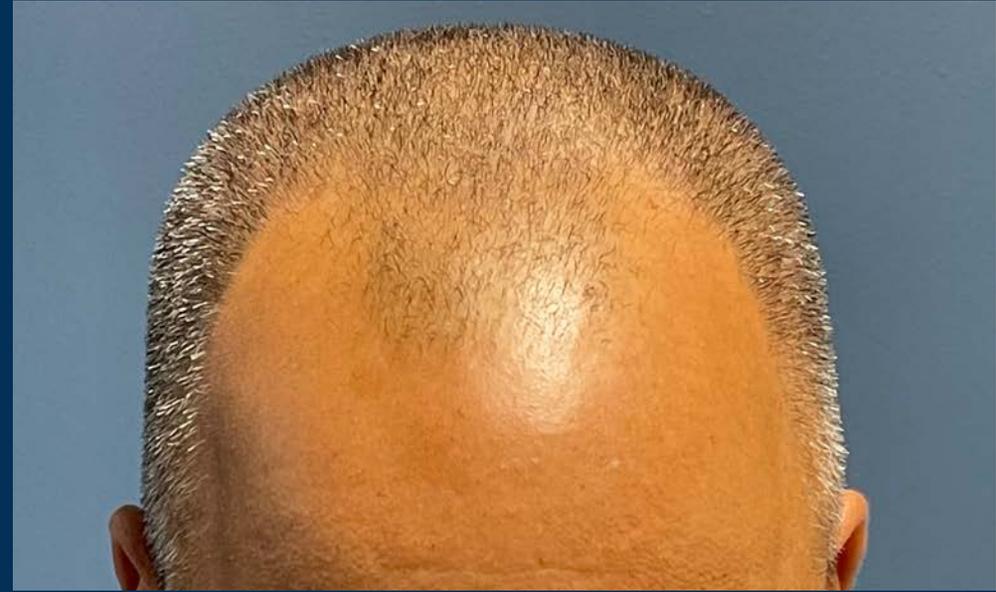

Some of the key differences include:

- Shorter procedure time
- Shorter recovery time
- No visible scarring, no limitations on future hairstyles
- More accurate hair harvesting
- Fewer hair follicles excised since a higher percentage are undamaged during excision
- More transplanted follicles that “take,” preventing the need for touch-up procedures
- Reduced physician fatigue lowers risks and potential errors
- FDA-cleared for both men and women
- Appropriate for most hair types and colors
- May be used in areas other than the scalp, including body hair, facial hair and eyebrows
- May be used to cover scarring (e.g. burns or previous scarring from strip hair restoration surgery)
